

User Manual:

Prepare the data to be **trained and tested** in the following format:

- label/class should be contained in a separate file named as **label_dataset-name.csv**
- The remaining attributes should be contained in a file named as **dataset-name.csv**.
- Make sure you have **pre-processed the datasets**, i.e filled missing values, string value to equivalent int/double value.
- **Remove the attributes heading** in the csv file from the top row.

These are done in order for the smooth running of the program.

To run any algorithm only the **main_algorithm-name.py**(eg. **main_harris.py**) file has to be run, other files are the packages made for support function.
